The FabLab

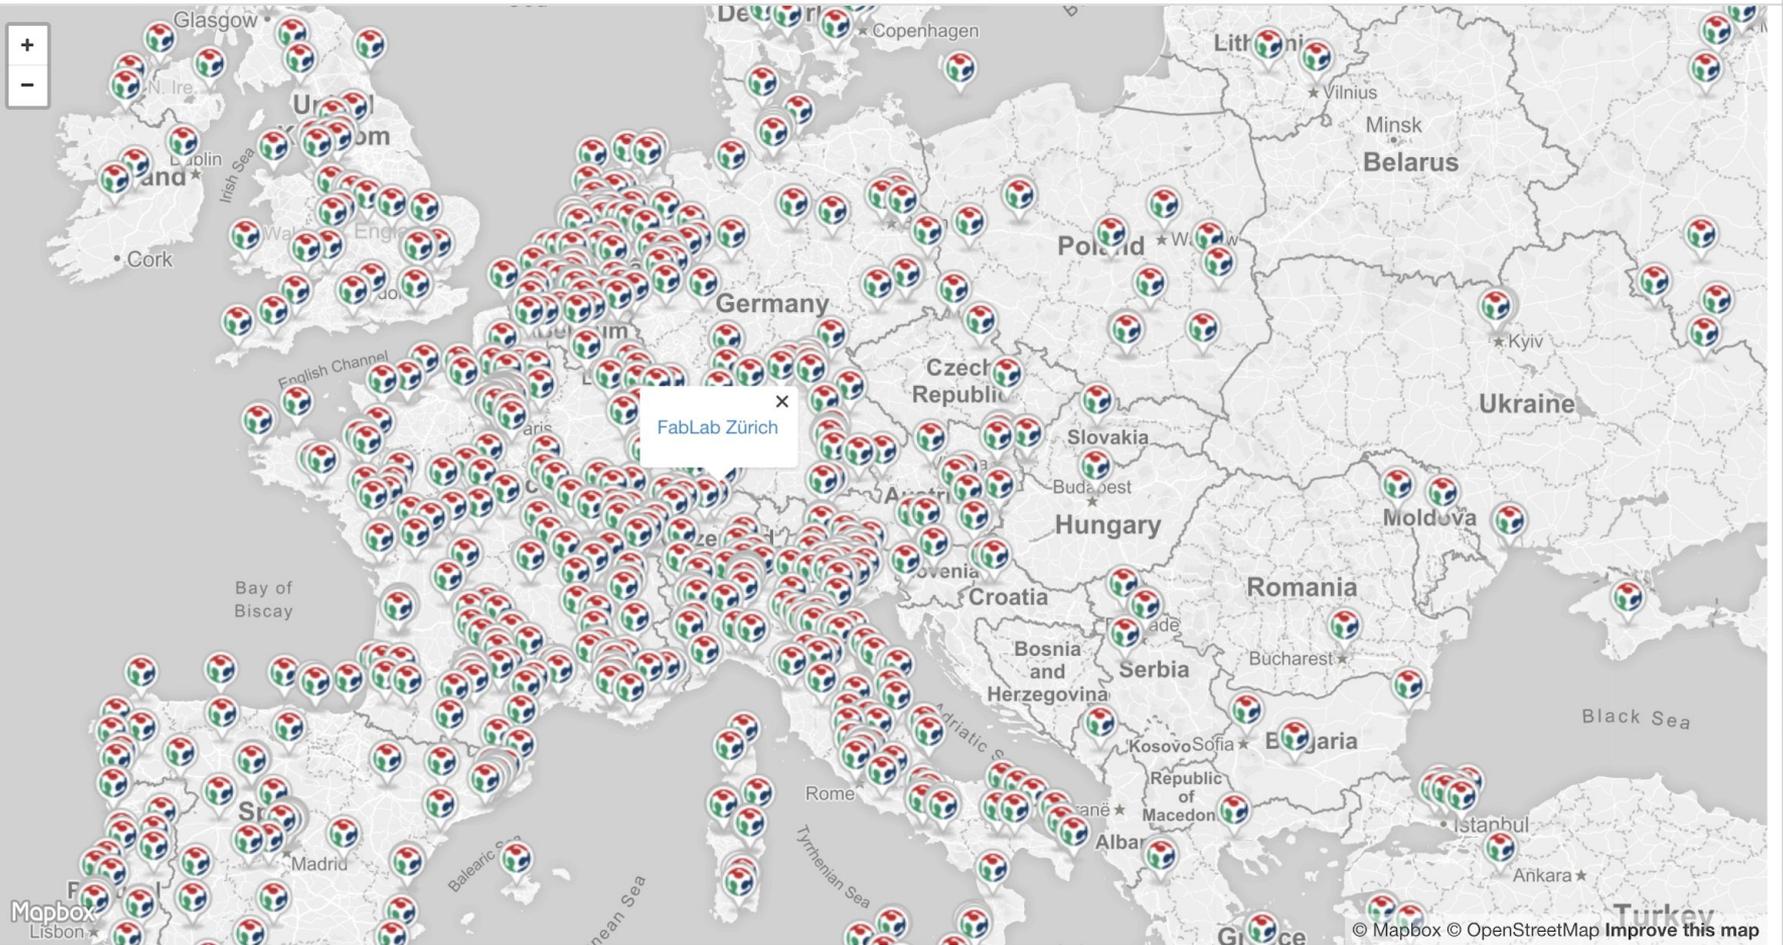

The Fab Charter

What is a fab lab?

Fab labs are a global network of local labs, enabling invention by providing access to tools for digital fabrication

What's in a fab lab?

Fab labs share an evolving inventory of core capabilities to make (almost) anything, allowing people and projects to be shared

Willkommen im FabLab Zürich

Das FabLab Zürich bietet einen niederschweligen Zugang zu modernen digitalen Fabrikationstechnologien.

Weather Proof, Bluetooth Capable RFID Reader

By tamberg in Outside > Water 68,071 153 97 Featured

Favorite

This instructable connects the popular **BlueSmirf Bluetooth module** to the **ID12 RFID reader** and shows how to make a dust and water resistant ([IP55](#)) RFID reader that sends IDs to your PC or mobile phone over Bluetooth radio without an additional micro controller and without an external power source. Created as a [prototype](#) for an [online swim lap counter system](#) named [Rfish](#), it can be used for any project in need of a self contained, weather proof RFID reader.

Hey Tamberg, Great article, I'm just beginning to learn about RFID for a project I am working on and this is going to help a ton. I wonder if you know if I could use a similar application to build an RFID reader for a door that is wirelessly re programmable over Bluetooth. For instance, I would like to reprogram the RFID reader over Bluetooth to "admit" specific RFID tags that I send to the reader over Bluetooth and be able to remove old RFID tag's access over Bluetooth as well. Thanks again!

Hi landonhm85, in the current setup Bluetooth merely replaces the cable between the reader and a PC (or mobile phone). There is no application logic in the box itself. So, as long as your system includes a PC to check and manage IDs it could work. To really save admitted IDs on the reader or "in the box" you'd probably need an additional microcontroller (e.g. an Arduino) and some flash storage. Regards, tamberg

Better IoT Principles

This work by betteriot.org is licensed under [Creative Commons BY-SA 4.0](https://creativecommons.org/licenses/by-sa/4.0/).

Introduction

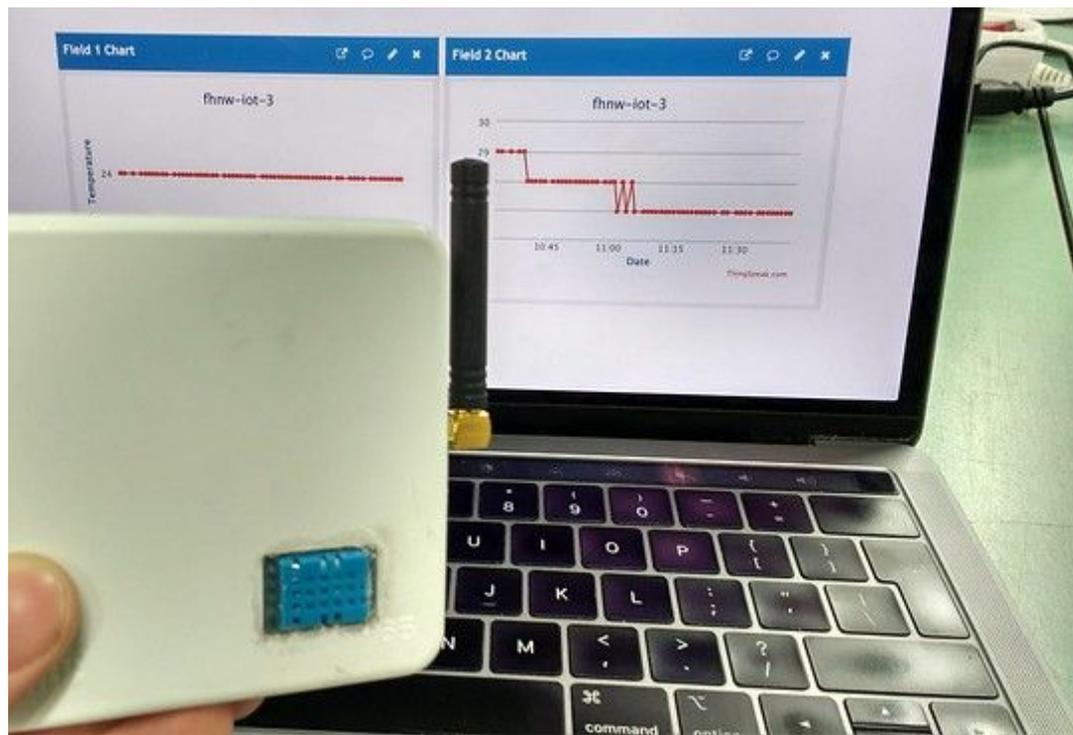

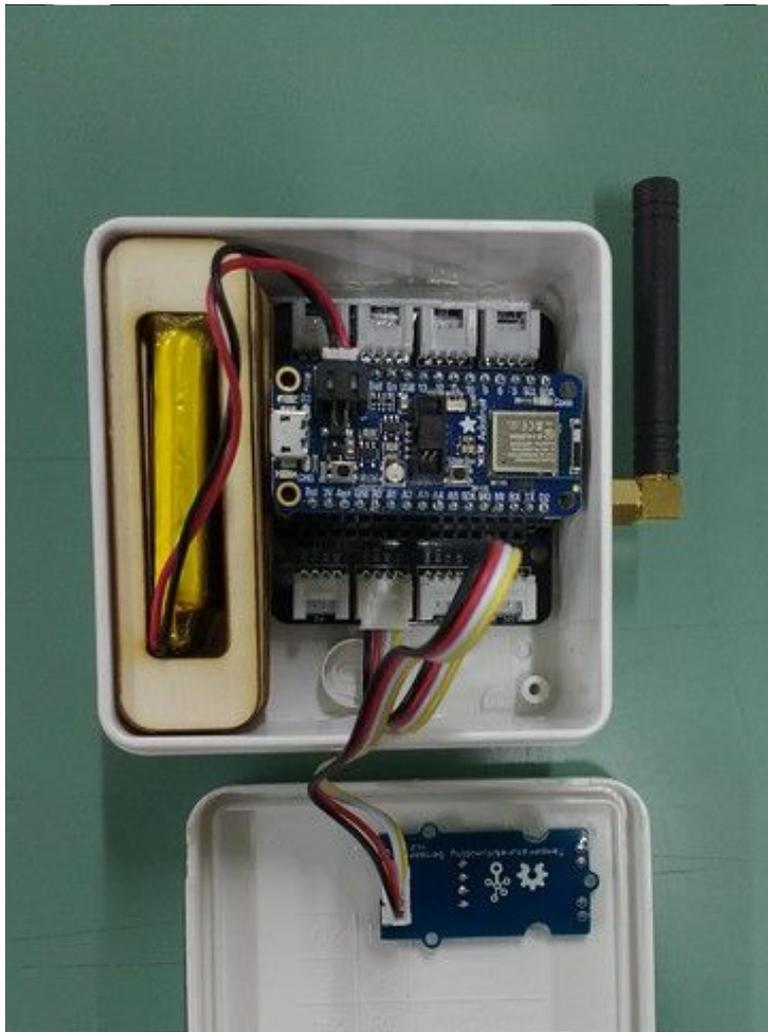

This is the latest version of a working document to develop [a certification mark for connected products](#) by IoT community members worldwide. This is a work in progress and you may [comment](#) freely, join the conversation on [Slack](#), [sign up to our newsletter](#) or give us feedback in writing (alex@iot.london) or on our [monthly open calls](#).

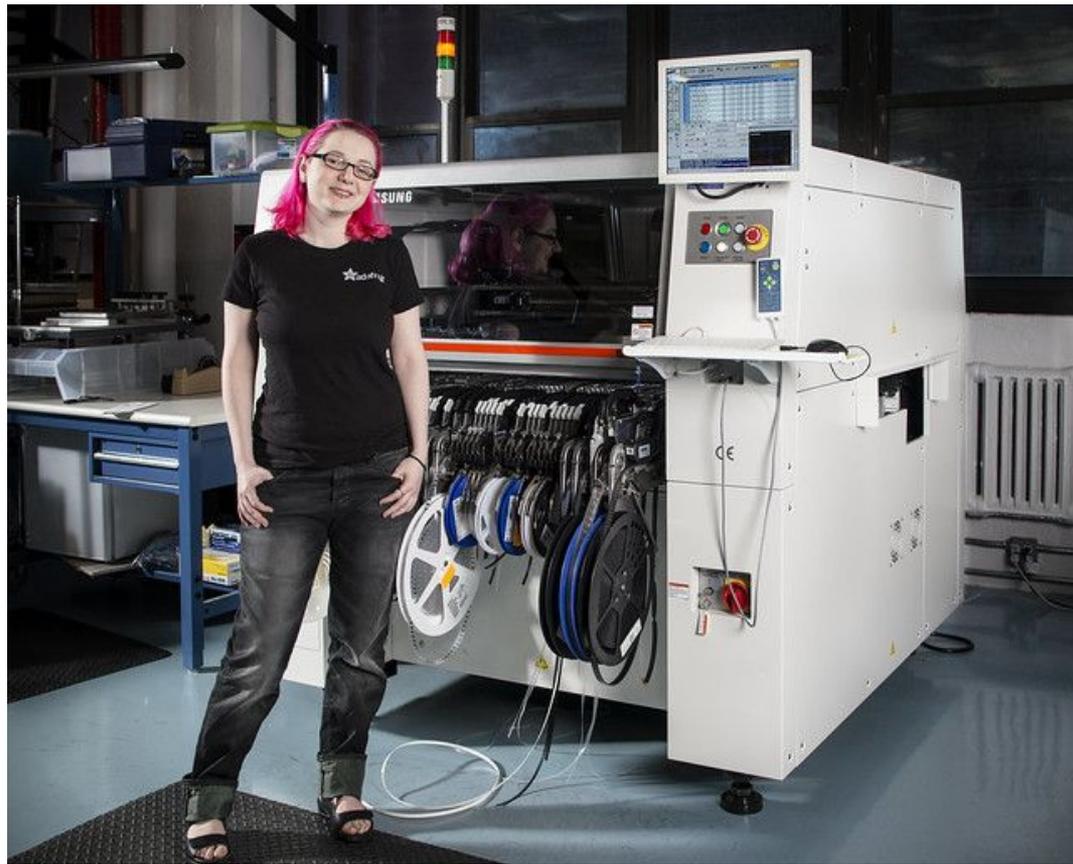

This is a set of principles that we think a vendor — a connected product manufacturer, team or founder — would use to make a good, secure, ethical, product that also takes into account the General Data Protection Regulation (GDPR). But also to push beyond the GDPR and look at the entire life cycle of a smart device. From manufacture, to final disposal.

Swiss Chapter of

Tangible Statistics

We did some explorations on how to use a MakerBot DIY 3D Printer to make open data easier to grasp. An introduction can be found here:

http://www.tamberg.org/makeopendata/2012/Tangible_Statistics_with_MakerBot.pdf

A data set and visualization from the Ville Vivante project (<http://villevivante.ch/>) kindly donated by [@wiederkehr](#) was used to explore different 3D interpretations.

Wearable data in the form of earrings is quick to print and quite effective despite the cheap material.

Maker Faire

Maker Faire is a family-friendly festival for digital crafts and new technologies, with a focus on making, learning and sharing.

The event is an opportunity for exponents of the maker and Do it Yourself movement to present their work to a broad, interested public and pass on their excitement through interactive exhibits, workshops, discussions and talks.

[Program & Workshops](#)

Families, kids and young adults in particular are presented with numerous and playful ways to discover
